

DataSync Agent

Fluorine+

The **Perspectium DataSync Agent (previously Replicator Agent)** is a standalone agent that listens for, transforms, and routes data messages that are shared from ITSM applications to on-premises data stores. With the DataSync Agent, you can easily share live data in real time as it is being created and/or updated (dynamic share) or share in bulk data at scheduled intervals that you can specify (bulk share).

After installing the DataSync Agent, you will be able to share data to on-premises databases. The DataSync Agent is set up to handle all database actions such as querying data and inserting records as well as converting the data to and from the message formats needed to communicate with the Perspectium Integration Mesh cloud server.

Popular DataSync for ServiceNow Agent topics:

Get started with the DataSync Agent

Sync your ServiceNow data to your on-premises database or application using the Perspectium DataSync Agent.

Agent Requirements

View supported database, operating system, and Java requirements for setting up the DataSync Agent.

Agent SDK

Leverage the DataSync Agent SDK to create additional handlers and customize or alter existing Java handler capabilities.
