

# Use a percentage of workers to run concurrent bulk shares

Fluorine+

In ServiceNow scheduled bulk shares, there is an option to enable repeating jobs so that multiple scheduled bulk shares can run concurrently. Once this option is enabled, however, you may notice that the repeating scheduled bulk share jobs impact the performance of your ServiceNow instance. If this happens, a good troubleshooting practice is to specify a **percentage of the workers** on your ServiceNow instance's nodes that will **run these scheduled bulk shares concurrently**.

## Procedure

To use a percentage of workers on your ServiceNow instance's nodes to run concurrent bulk shares, follow these steps:

1

### Access Replicator Properties in ServiceNow

Log into your sharing (source) ServiceNow instance and navigate to **Perspectium > Replicator > Properties**.

2

### Enable % of workers used to run concurrent bulk shares

Scroll down toward the bottom of the page and choose an option from the dropdown under **% of workers used to run concurrent bulk shares**. The percentage that you choose from the dropdown will be the percentage of workers in each of your ServiceNow instance's nodes that will be used to run scheduled bulk shares that are being executed concurrently.

Then, click **Save** at the bottom of the page to save your changes to Replicator Properties.

% of workers used to run concurrent bulk shares ([More Info](#))

90% ▾

Save

**Choose a percentage from the dropdown. Then, click Save.**
