

Execute a table compare for a group share

Fluorine+

The **table compare** feature allows you to compare the records in tables from one ServiceNow instance with the same records in another ServiceNow instance. With table compare, you can see a table's record counts on both instances as well as any record discrepancies between two instances that might exist.

Prerequisites

⚠ First, you will need to [create a group share with the Table Compare option enabled](#).

Procedure

To execute a table compare, follow these steps:

1. Log into the ServiceNow instance you are sharing from and navigate to **Perspectium > Group Share > Group Share** or simply type **Group Share** in the Filter Navigator on the upper left-hand side of the screen. and then click **Group Share**.
2. Click into the group share that you want to execute a table compare for.
3. Scroll down to the **Related Links** section and click the **Execute table compare** link. Then, click the **PSP Table Compares** tab to view the results of your table compare.

The **Local Record Count** field indicates how many records exist for a specified table in your current instance, and the **Target Record Count** indicates how many records exist in the target instance you are group sharing to. If any discrepancies exist between your two instances, the **Compare Rows Status** field will display the status **Completed with Discrepancies**.
