

# Alert before bulk sharing a large number of records

Fluorine+

In Replicator Properties, the option to **alert me before bulk sharing a large number of records** will enable an alert to pop-up within your instance whenever a ServiceNow bulk share that you're trying to execute exceeds a minimum number of records.

**NOTE:** The functionality to be alerted when sharing 1,000,000 or more records in a ServiceNow bulk share is enabled by default.

## Prerequisites

⚠ First, you will need to [install Replicator for ServiceNow](#) and [run the Perspectium Finish Install scripts](#).

## Procedure

To be alerted whenever you try to run a bulk share for a minimum number of records, follow these steps:

1

### Access Replicator Properties

Log into your sharing ServiceNow instance and navigate to **Perspectium > Replicator > Properties**.

2

### Enable alerts for bulk sharing a minimum number of records

Check the box labeled **Alert me before bulk sharing a large number of records**. Then, enter the minimum number of records being bulk shared that will trigger this alert in the field labeled **Minimum number of records to trigger an alert before bulk sharing**. Finally, scroll down to the bottom of the page and click **Save** to save your changes.

The screenshot shows the ServiceNow Service Management interface. The left sidebar contains a navigation menu with the following items: Perspectium, Replicator (expanded), Homepage, Properties, Ready to Run, Data Obfuscation Dashboard, Dynamic Share, Bulk Share, Subscribe, Subscribed Queues, Shared Queues, and Scheduled Bulk Shares. The main content area displays the 'Properties' page for the 'replicator' table. The page includes several configuration options: 'Share fields that belong to the selected table only. This will result in missing fields from the base (parent) table.' (checkbox), 'Encryption key for shared data (must be 24+ characters or, for AES-256 encryption, 32+ characters)' (text input), 'Decryption key for subscribed data (must be 24+ characters or, for AES-256 encryption, 32+ characters)' (text input), 'Specify how data is encrypted before being shared. 'encrypted' uses the same encryption as ServiceNow's password 'encrypted\_multibyte' base 64 encodes data before encrypting.' (dropdown menu set to 'encrypted'), 'Skip updating the sys\_domain\_path field when subscribing to records. This option applies to domain-separated instances' (checkbox), and 'Alert me before bulk sharing a large number of records' (checkbox, checked). Below this is the 'Minimum number of records to trigger an alert before bulk sharing' field, which is set to '1000000'. Red arrows point to the checked checkbox and the input field, with text overlays: 'Check to enable alerts for large bulk shares' and 'Enter minimum records in a bulk share to trigger these alerts'.

servicenow Service Management

System Administrator

replicator

Share fields that belong to the selected table only. This will result in missing fields from the base (parent) table.

Encryption key for shared data (must be 24+ characters or, for AES-256 encryption, 32+ characters) (show decryptec)

Decryption key for subscribed data (must be 24+ characters or, for AES-256 encryption, 32+ characters) (show deCRY)

Specify how data is encrypted before being shared. 'encrypted' uses the same encryption as ServiceNow's password 'encrypted\_multibyte' base 64 encodes data before encrypting.

encrypted

Skip updating the sys\_domain\_path field when subscribing to records. This option applies to domain-separated ins
