

DataSync Agent

The **Perspectium DataSync Agent** is a standalone agent that listens for, transforms, and routes data messages that are shared from ServiceNow or Salesforce to on-premises data stores. With the DataSync Agent, you can easily share live data in real time as it is being created and/or updated (dynamic share) or share in bulk data at scheduled intervals that you can specify (bulk share).

The DataSync Agent will consume messages from a queue via the Perspectium Integration Mesh, decrypt the message, and convert it to the expected format to save into the target system or database. Once a message is consumed and processed, it will be gone, as the Agent does not keep any messages long term.
