Run Finish Install scripts

Fluorine

After committing any Perspectium update sets to your ServiceNow instance, the **Finish Install** scripts must be run in order for your Perspectium applications to function correctly. Finish Install will check if the Perspectium application is in the global scope, run jobs to install properties for the application, start running scheduled jobs, and reset dynamic share rules. By running the Finish Install script, you will not overwrite your current Perspectium properties.

NOTE: You should run the Finish Install script if you are installing Replicator for ServiceNow for the first time or upgrading your Replicator for ServiceNow version. The Finish Install scripts can also be run after committing multiple Perspectium update sets for ServiceNow.

Procedure

To run the Finish Install scripts, follow these steps:

1

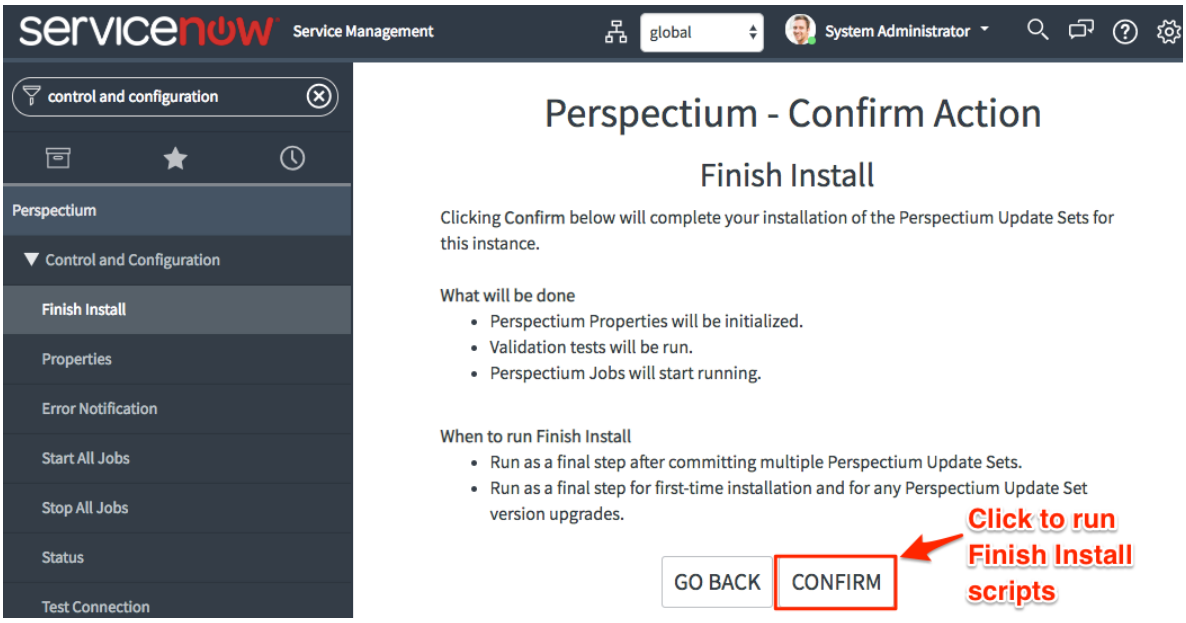
Log into ServiceNow

Log into your sharing ServiceNow instance and navigate to **Perspectium** > **Control and Configuration** > **Finish Install**.

2

Run the Finish Install scripts

At the bottom of the form, click **Confirm** to start running the Finish Install scripts.



Next steps

Create a ServiceNow dynamic share

Create a ServiceNow bulk share

Create dynamic shares and bulk shares with Ready to Run
