

# Deploy Apex triggers in a Salesforce production organization

## Fluorine

To deploy Apex triggers in your Salesforce production organization, you will need to create them Apex triggers in a sandbox organization and then move the triggers over to your production organization. You can move the triggers in this way using [change sets](#). When deploying change sets, you may need to add a [test class](#) that tests your trigger's Apex code to ensure 75% coverage of all Apex code. By default, the Perspective Managed Package comes with a test class that covers the basic components of Perspective's dynamic share Apex triggers.

## Prerequisites

---

⚠ First, you will need to [install the Perspective Package for Salesforce](#).

⚠ You will also need to [configure your Salesforce remote site settings](#).

## Procedure

---

To deploy Apex triggers in a Salesforce production organization, follow these steps:

1

Log into your sandbox Salesforce organization and click the  icon in the top right-hand corner of the screen. Then, click **Setup**.

2

In the Quick Find window on the left side of the screen, type and then click **Apex Test Execution** (under **Custom Code**).

3

In the upper left-hand corner of the Apex Test Execution form, click **Select Tests...**

4

For any tests that need to be run, check the box next to each test and then click the **Run** button.

5

In the Quick Find window on the left side of the screen, type and then click **Outbound Change Sets** (under **Environments > Change Sets**).

6

At the top of the Change Sets list, click the **New** button.

7

Type any name for the change set. Then, click **Save**.

Under the Change Set Components section, click **Add**.

Change Set

### Sample Change Set

[Back to List: Outbound Change Sets](#)

A change set contains customizations to components such as apps, objects, reports or email templates. You can use change sets to move customizations from one organization to another.

After a change set has been uploaded, its components aren't refreshed and you can't add or remove components. To refresh the source of components and modify the component list, clone the change set.

**Change Set Components** Add View/Add Dependencies

This change set contains no components

Add View/Add Dependencies

**Profile Settings For Included Components** Add Profiles

Click to add a change set component

9

From the Component Type dropdown, choose **Apex Trigger**. Then, check the boxes next to the Apex triggers you want to include:

Apex Trigger	Triggers dynamic sharing of...
PSP_Case_Local_Attachment_CaseTrigger	attachments added to Salesforce case records
PSP_Case_Local_CaseTrigger	Salesforce case record data (excluding attachments and document links)
PSP_Case_Local_ContentDocumentLink_CaseTrigger	document links added to Salesforce case records

Finally, click **Add To Change Set** to finish adding the Apex triggers to the change set.
