

Create a ServiceNow bulk/dynamic share for Splunk

Fluorine

To enable the sharing of ITSM data from your ServiceNow instance to your Splunk instance, you will need to [create a ServiceNow bulk share](#) and/or a [ServiceNow dynamic share](#). A ServiceNow bulk share is a one-time transfer of data from your ServiceNow instance. A ServiceNow dynamic share allows for real time sharing of ServiceNow records as they are created, updated, and deleted. Creating a bulk share and/or dynamic share will share out your ServiceNow data immediately as well as share out subsequent data that is collected as ServiceNow records are created, updated, and deleted.

Prerequisites

⚠ You will first need to [install the Perspectium Core update set](#). You can request a download link for this update set by contacting [Perspectium Support](#).

⚠ You will also need to have a [ServiceNow shared queue](#) that points to your Splunk instance. This queue should have been created by [Perspectium Support](#) upon initial configuration of your ServiceNow instance.

Procedure

To create a bulk/dynamic share for your ServiceNow-to-Splunk integration, follow these steps:

1

To create a bulk share, navigate to **Perspectium > Replicator > Bulk Share** or simply type **Bulk Share** in the Filter Navigator on the upper left-hand side of the screen. Otherwise, continue to **Step #3**.

2

Click the **New** button next to Bulk Shares. In the resulting form's **Cipher** dropdown, select **Base64 Encode Only**. Then, follow the remaining steps to [create a ServiceNow bulk share](#) for Replicator for ServiceNow.

3

To create a dynamic share, navigate to **Perspectium > Replicator > Dynamic Share** or simply type **Dynamic Share** in the Filter Navigator on the upper left-hand side of the screen.

4

Click the **New** button next to Replicator Configurations. In the resulting form's **Cipher** dropdown, select **Base64 Encode Only**. Then, follow the remaining steps to [create a ServiceNow dynamic share](#) for Replicator for ServiceNow.
