

ServiceNow subscribe

Fluorine

Subscribers are application instances or Perspective-supported agents that listen for and then consume data from sharing instances. The **Subscribe** module (under **Perspective > Replicator**) allows you to set up the configurations for a subscribing action on data that is being shared from other applications, databases, or agents.

Configure a ServiceNow instance as a subscriber

Set up a subscribe action and a subscribed queue that will allow shared data to arrive at your ServiceNow instance.
